# Implement SVM/Decision tree classification techniques

#### AIM:

To Implement SVM/Decision tree classification techniques using R.

#### **PROCEDURE:**

- 1. CollectandloadthedatasetfromsourceslikeCSVfilesordatabases.
- 2. Clean and preprocess the data, including handling missing values and encoding categorical variables.
- 3. Split the dataset into training and testing sets to evaluate model performance.
- 4. Normalize or standardize the features, especially for SVM, to ensure consistent scaling.
- 5. Choose the appropriate model: SVM for margin-based classification, Decision Tree for rule-based classification.
- 6. Train the model on the training data using the 'fit' method.
- 7. Makepredictionsonthetestingdatausingthe`predict`method.
- 8. Evaluate the model using metrics like accuracy, confusion matrix, precision, and recall.
- Visualize the results with plots, such as decision boundaries for SVM or tree structures for Decision Trees.
   10.Fine-tune the model by adjusting hyperparameters like 'C' for SVM or 'max depth' for Decision Trees.

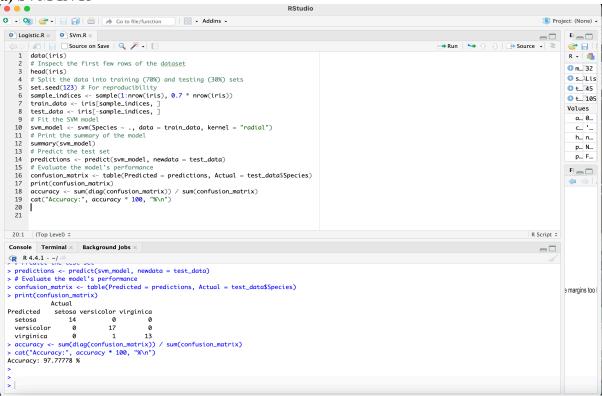

#### CODE:

```
data(iris)
# Inspect the first few rows of the dataset
head(iris)
# Split the data into training (70%) and testing (30%) sets
set.seed(123) # For reproducibility
sample_indices <- sample(1:nrow(iris), 0.7 * nrow(iris))
train_data <- iris[sample_indices, ]
test_data <- iris[-sample_indices, ]
# Fit the SVM model
svm_model <- svm(Species ~ ., data = train_data, kernel = "radial")
# Print the summary of the model
summary(svm_model)
# Predict the test set
predictions <- predict(svm_model, newdata = test_data)
```

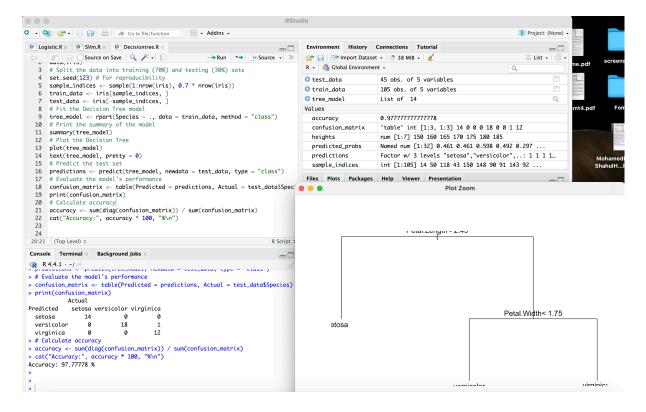

# Evaluate the model's performance confusion\_matrix <- table(Predicted = predictions, Actual = test\_data\$Species) print(confusion\_matrix) accuracy <- sum(diag(confusion\_matrix)) / sum(confusion\_matrix) cat("Accuracy:", accuracy \* 100, "%\n")

#### **OUTPUT:**

## a) SVM IN R

# b)Decision tree:

### **RESULT:**

Thus, Implement SVM/Decision tree classification techniques has been successfully executed.
